

Pomodoro-Focus-Timer

User Guide — Made by Romonasa

So, what is this?

Right before an exam, in the middle of a thesis, or on a workday that's turned into back-to-back meetings: finding focus is rarely the hard part — holding onto it is. That's exactly what this timer helps with.

The Pomodoro technique splits your time into short, manageable chunks with breaks in between — a proven way to beat procrastination and stay focused for hours, not just minutes. This timer brings that to life, for free, no account, no install:

- **Students (school & university):** great for homework, study sessions and exam prep — including presets like “Deep Work” or “Ultradian” for longer study blocks when 25 minutes just isn't enough
- **Working professionals:** the built-in meeting mode gives you a heads-up before a meeting ends, so nothing has to be cut off mid-sentence anymore
- **Anyone who relies on accessibility:** high contrast, flash-free alerts, full keyboard control and screen reader support are built in from day one, not bolted on afterward

Exactly how to open the timer is coming up next, step by step.

Getting started

This is the easiest way, and it's all most people will ever need:

1 Tap or click this link:

romonasa.github.io/pomodoro-focus-timer/Pomodoro-Focus-Timer.html

2 That's it.

The timer shows up right away. You can start using it immediately.

What's a “link”? A link is basically a signpost on the internet. Tap or click it once, and the right page opens on its own — just like any other website you've ever visited.

Works on any device: computer, laptop, tablet or phone, Windows, Mac, iPhone/iPad or Android, doesn't matter. **Only requirement:** you'll need an internet connection the first time you open it (Wi-Fi or mobile data). Once it's open, the timer keeps running even if the connection drops later.

Phone tip: Open your browser menu (usually three dots, or an icon at the top/bottom of the screen) and choose “Add to Home Screen” — you'll get an icon on your phone that looks just like a regular app.

No internet right now?

You'll only need this if you want to use the timer somewhere without internet access (e.g. a school with no Wi-Fi). Otherwise, feel free to skip this section.

1 Download the file.

Downloads a single file called "Pomodoro-Focus-Timer.html".

2 Save it anywhere.

Your Downloads folder or your desktop, for example — wherever you'll remember it.

3 Double-click to open it.

The timer opens, this time with no internet needed at all.

Good to know: this downloaded file and the link above don't "know" about each other. If you sometimes use one and sometimes the other, your saved times might not match up. That's not a bug, just something worth knowing.

A Windows extra (entirely optional)

Also completely optional — just for anyone who'd like things a bit tidier, without browser tabs or an address bar around it.

1 Download "Pomodoro-Focus-Timer-starten.bat".

2 Double-click to open it.

Opens the timer in its own small window, kind of like a real app. Needs Chrome or Edge, plus an internet connection at startup.

If a warning pops up, or nothing happens at all: no problem, just use the link above instead. Nothing is lost.

Using the timer

The four tabs at the bottom

At the bottom you'll see four words to tap: **Focus**, **Short Break**, **Long Break** and **Meeting**. That's how you choose what should run right now. After four focus rounds, the timer switches to the long break on its own.

The four corner buttons

- **Top left (triangle):** Start. While the timer is running, this turns into a pause button.

- **Top right (gear):** opens the settings.
- **Bottom left (circular arrow):** resets the current time back to the start.
- **Bottom right:** skips the current round and moves to the next one.

The small icons in the middle

- **Speaker:** sound on or off (crossed out = off)
- **Moon:** lights up while a break is running
- **Camera aperture:** glows cyan while Focus or Meeting is running
- **Bell:** notifications on or off (crossed out = off)

The first time you tap the bell, your device will ask once whether it's allowed to show you notifications. Tap "Allow" there, otherwise this feature just stays quiet.

Typing in a time yourself

Tap the big number in the middle, type a new number, press Enter to confirm. On a computer you can also type a colon (e.g. "25:00"). On a phone, digits alone are enough: "25" gives you 25 minutes, "100" gives you 1 minute (the timer reads the last two digits as seconds automatically). In Meeting mode, short numbers always count as minutes ("120" gives you 120 minutes), since exact seconds never really matter there.

Settings

Tap the gear icon top right to find: ready-made time presets to tap, your own times via plus/minus, a heads-up warning for meetings, and different color themes and font sizes under "Appearance".

Keyboard shortcuts

Prefer typing over clicking? **Spacebar** starts or stops the timer, **R** resets it.

For people with specific needs

This timer was deliberately built so that as many people as possible can use it comfortably:

- **Strong contrast:** a dedicated "Contrast" color theme (black/white) for anyone who sees less well or is sensitive to color.
- **No flashing:** the "Calm display" option replaces flashing effects with one gentle, single glow — important for anyone who can get headaches or worse from flashing lights.
- **Large text:** the time display can be made bigger.
- **Fully usable without a mouse:** everything works with just a keyboard too.
- **Read-aloud support:** if you have a screen reader turned on (e.g. Narrator on Windows, or VoiceOver on iPhone), important changes are read out automatically.

Keeping it always in view

The screen icon up top pops the timer out into a small floating window that stays on top of every other program — a bit like the little video window that's sometimes left over during video calls. Desktop only, with Chrome or Edge.

Your settings stick around

Anything you set (times, colors, etc.) is remembered automatically — even after you close it and come back later. Nothing is ever sent anywhere; it all stays on your own device.
